

Things you should know how to do at UO so that your life is Long and Prosper

1.- Know what the Enhanced Razor is

A. It is a program that acts as an intermediary between the UO client and the UO server, in this way it can carry out extra activities that the client has not designed, such as:

- a) empty the contents of one container into another.
- b) increase taming from 0 to 120 without human intervention
- c) mine the entire planet
- d) shout a joke in Spanish before casting a spell!

As you can see, its possibilities are almost unlimited, more than anything limited by the imagination and skill of its programmer. This program is free and is available in the basic UOAlive starter package located here <https://uoalive.com/playnow.html>

Or exactly here https://files.uoalive.com/uoalivepackage7_0_101_2.zip .

Or if you want to install it personally and its most current version is located here

<https://razorenhanced.net/> .

If you follow the installation steps on the UOAlive page, this program will already be installed when you unzip the installation package, but do not forget to update it from time to time.

2.- How to install one of my Scripts in your Enhanced Razor installation

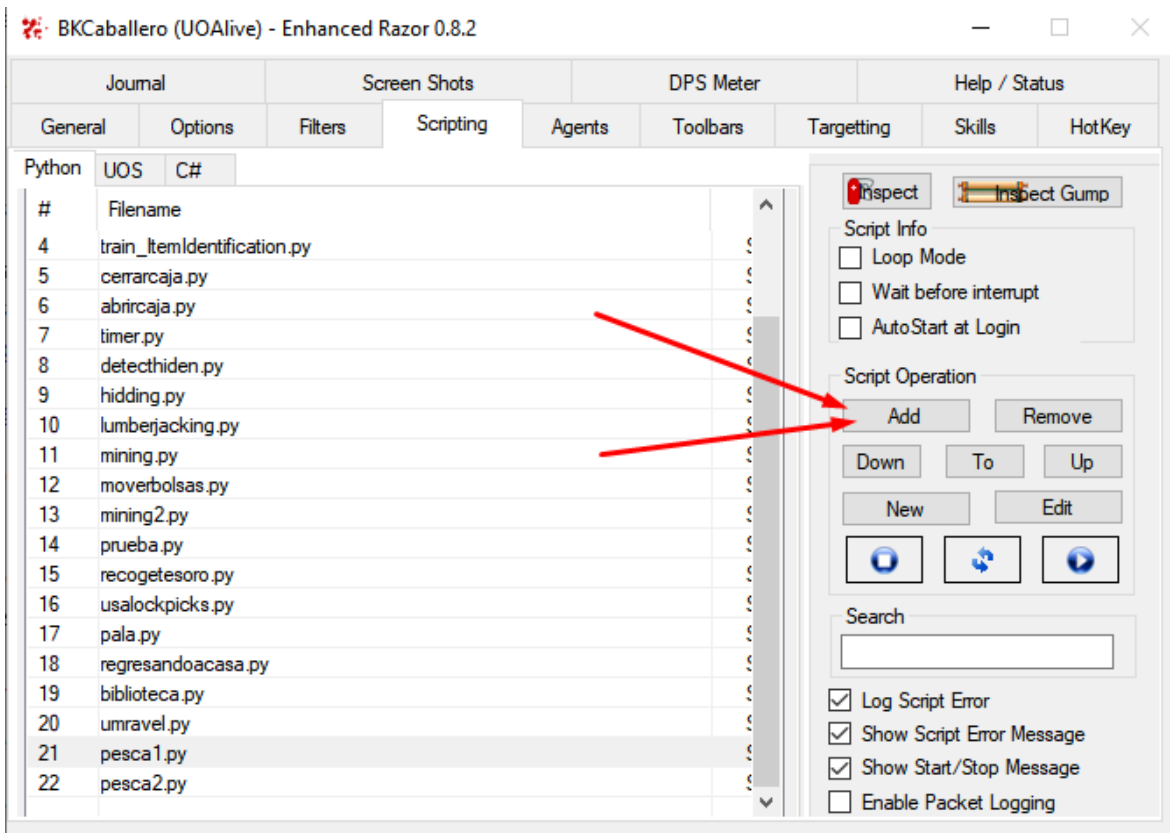

A. You just have to follow the following steps

- a) download the script from my repository here <https://github.com/jymnils2/UOAlive>
- b) place it in the Razor scripts directory, this is a little difficult to do since there are several ways to install the razor, in the UOAlive installer this is deep inside the directories that the package created, something like

▼ h:\UO\Part 1 Launcher\ClassicUO\Data\Plugins\RazorEnhanced-0.8.2.92\Scripts*.*

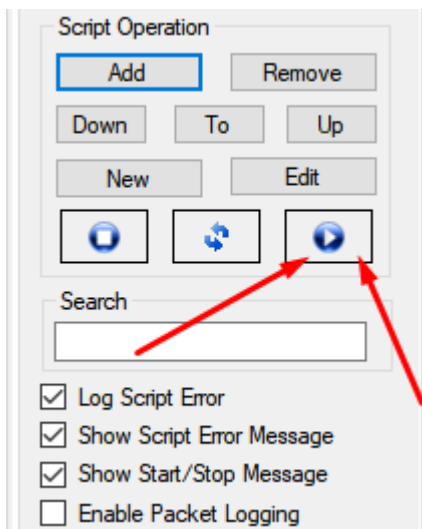

in my case, but in any case you can create a directory of your choice wherever you want and there you can download my scripts, the best thing is that they are in a separate directory and not just in the downloads folder, they can even be on the desktop, but That is your decision.

c) load the script inside the Razor, this is done here

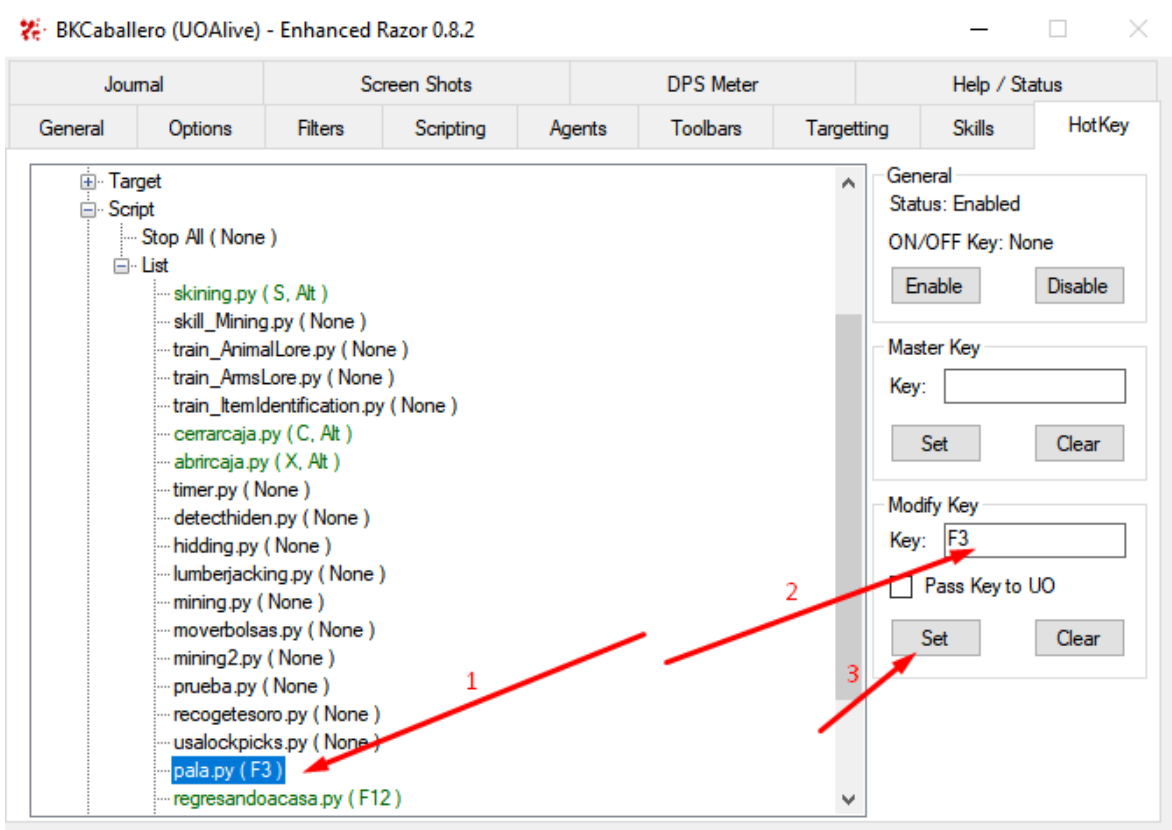

Which will allow us to navigate to where you have downloaded my scripts and add it to the Razor.

At this moment it is possible to run the script from the razor, but it is best to add an activation key to be able to see the result from the game window instead of the Razor window, if you still want to activate it from this window, here where you should click

But my recommendation is to do it from an assigned key, this is done in this window

First choosing the script, then choosing the key (I use the Fx) and then applying the Set button, this way we can place keys assigned to all our scripts, I change the configuration of the keys each time depending on the scripts I will use, to avoid having to remember 200 keys ;D

3.- How to run one of my Scripts

A. If you have followed everything exactly up to this point, all you have to do is press the keys assigned to the script of your choice and you will have managed to make your life easier in the UO.

Long life and prosperity!.

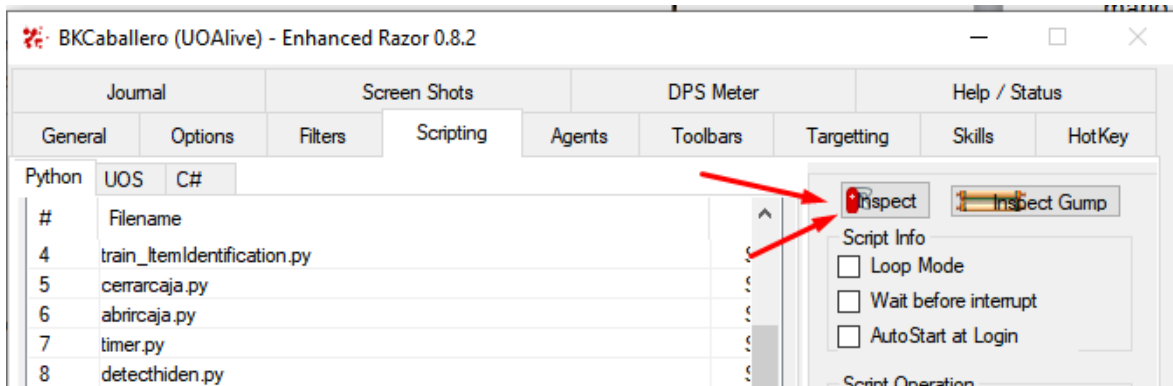

4.- How to get the Serial of an object to use it in the game.

A. The first thing is to understand what a Serial is in the game, the simple answer is that it is a UNIQUE number that identifies an object (item, user, mount, bag, book, etc.) within the game, two serials cannot exist. equals within the same server, in this way the exclusivity of everything you do is ensured, these serials usually look like this within my scripts

canadepesca = 0x41414DA6

It is very important to remember to save the items with which we execute the scripts, because if we change the item that we used with a script, the script will obviously tell you that the fishing rod in your hand does not exist, because it is not the same fishing rod whose code is inside the script.

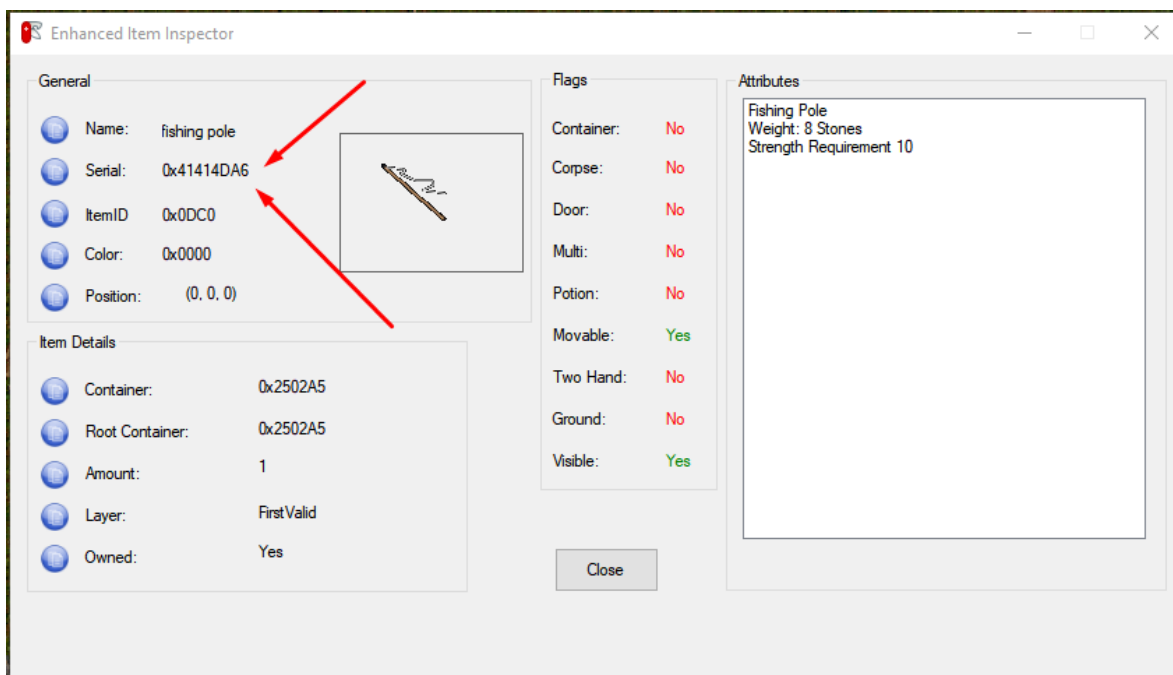

These serial numbers are obtained with the same help of the Razor

This will show us an objective that allows us to choose the item or entity within the game

Once the item has been chosen, it will show us an information screen like this:

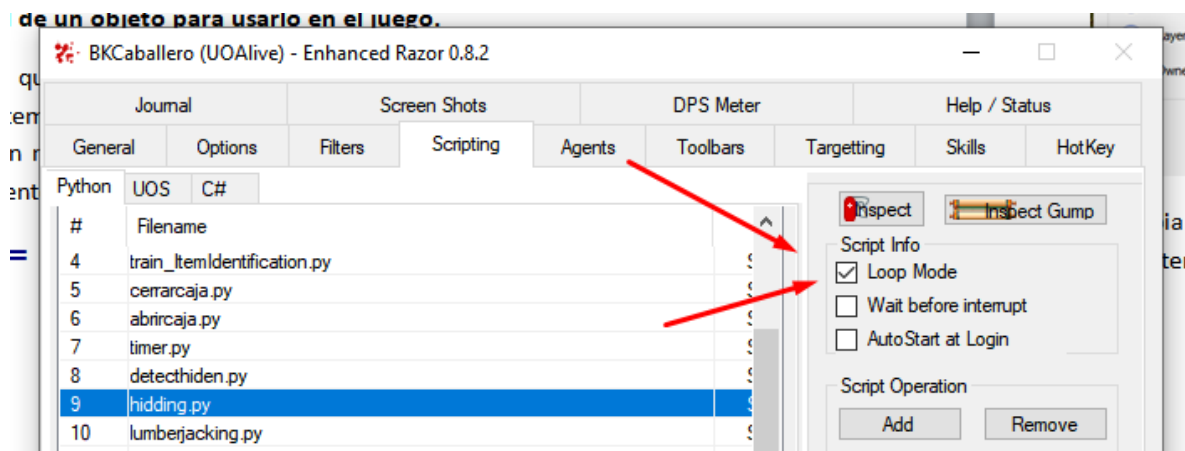

The serial of that exact point is copied by marking it in block and with CTRL+C and it is copied into the script that we are modifying.

5.- How to create an infinite training loop

A. The most important thing before doing this is to verify that the script has some type of delay within it, because repeating an action very quickly can get you banned from the game for violating the integrity of the server, most of the time the minimum waiting time between one action and another should be at least 500 milliseconds (lotting or transferring items between bags), the same goes for the skills of the game, there is a minimum time to be able to repeat them, for example fishing has to have an interval of 10 seconds, just as other skills such as mining or logging should have an interval of 1.5 to 2 seconds, given this as understood, let's continue.

To activate the repetition of the scripts we simply go to Loop Mode

As you will notice, the option does not have a delay clock, so the delay must be within the script, such as in the usalockpicks.py script.

```
Misc.Pause(1000) # esperar 1 segundo por diplomacia con el servidor
```

<https://github.com/jymnils2/UOAlive/blob/main/usalockpicks.py>

6.- How to make your animals follow you

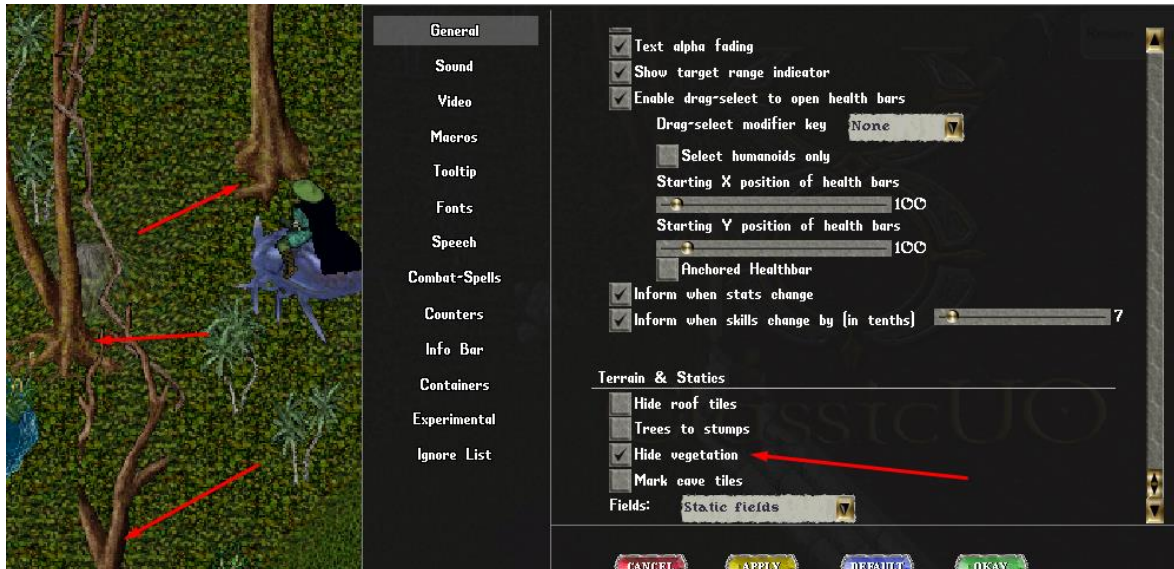

A. This is valid for all animals that you own and have 100% loyalty, you just have to press enter or simply type and say the following **All Follow Me**, this can be in uppercase, lowercase or all mixed

7.- how to hide the foliage

A. This client configuration not only hides the foliage, it also reduces graphical lag, and allows you to move faster, avoid mobs better, identify logs to cut and mini mines to mine.

The configuration is in this part of the client options

8.- Capacity of the Blue Beetle

A. A blue beetle has a carrying capacity of almost 1500 stones, with more training it will be able to increase its stats, especially STR that way it will be able to carry more load, but we must keep in mind that they are very delicate to train and that If they level up they could rebel because the miner has no animal taming or animal lore skill, one could artificially increase these skills with the use of jewelry to support a level 2 or perhaps 3 beetle but this is at the user's risk. .
